

Giant Desert Centipedes and **Common Desert Centipedes** are carnivorous, meaning that anything they can catch, they will eat! They have one pair of legs per segment. Centipedes are a **venomous** animal, meaning that they have to inject their venom.

Desert Millipedes have two pairs of legs per body segment. They are a **detritivore**, meaning they eat things like dead plants and fruits. When threatened, they curl up and release smelly, toxic chemicals from openings along their body.
